A More Effective Way to Fertilize

LiquidLife™ by Fertile Earth is formulated from the highest quality raw materials available and are free of the impurities, chlorides and heavy metals that are common in today's leading brands. **LiquidLife™** gives your plants the ultra pure nutrients they require without harmful chemicals or fillers.

LiquidLife™ Plant Foods are environmentally safe, non-toxic, non-corrosive and are formulated with a neutral pH. Our user-friendly formulas offer greater flexibility of application as they can be applied to the soil, roots or plant foliage. Formulated for use on all varieties of turf grass, field crops, fruits, vegetables, trees, shrubs, lawns, flowers and houseplants, you simply cannot buy a better plant food than **LiquidLife™**.

Compared to others on a price per ton basis, liquid plant foods would seem overpriced, or comparing the amount of plant food being applied, it would appear liquid plant foods are not providing enough N, P, and K (Nitrogen, Phosphorous and Potassium) to be profitable. **A closer, however, look will explain why and how liquid plant foods can do the job competitively.**

Made of costly high-grade raw materials, **LiquidLife™** can be applied directly on the seed, the soil or as a foliar spray. University research has found this fertilizer to be 90 to 95 percent available to the plant during the growing season. Dry granular fertilizers using less costly raw materials are basically toxic to the plant and must be applied to the soil, which in turn gives it over to the plant. Normally much efficiency is lost in the process due to weather conditions and the chemical make up of the soil tending to "tie-up" nutrients. As a result, nearly all the universities have found the availability of dry fertilizers to average between 10 and 20%. Typically then, 300 pounds of a dry 10-20-10 fertilizer applied to the ground would find only 60 pounds (20% of 300lbs.) actually becoming available to the plant during the growing season. On a pound-for-pound basis, our liquid fertilizer is better utilized by plants.

Just 6 gallons of **LiquidLife™ Plant Food** would provide as much nutrition as 300 pounds of a dry fertilizer. Actual expense figures usually show **LiquidLife™ Plant Foods** saving from 15 to 30% over dry fertilizer costs per acre.

LiquidLife™ by Fertile Earth is also available with **BioNatra™** an ingredient that enhances the effect of Fertilizer. **BioNatra™** is an all-natural bio-stimulant that provides micronutrients, complexed carbohydrates, vitamins, amino acids and other biological growth activators designed to increase levels of healthy microbial activity in the soil. University studies have shown that **BioNatra™** increases biological activity by 2000% with 48 hours of application which accelerates natural biodegradation, loosens soil, lowers sodium levels and stimulates deep root development resulting in healthier plants and higher yields.

So, why buy what you can't use or might lose? Buy the best and save the most with **LiquidLife™ by Fertile Earth**. **For specific recommendations and pricing contact us or your local distributor.**
